The Translator’s Other Invisibility: Stylometry in Translation

SLE 2013

Translator’s Invisibility

A translated text, whether prose or poetry, fiction or nonfiction, is judged acceptable by most publishers, reviewers, and readers when it reads fluently, when the absence of any linguistic or stylistic peculiarities makes it seem transparent, giving the appearance that it reflects the foreign writer’s personality or intention or the essential meaning of the foreign text—the appearance, in other words, that the translation is not in fact a translation, but the “original.”

Translator’s Style?

Little or no attention has been paid so far to the possibility of describing the ‘style’ of a translator or group of translators in terms of what might be distinctive about the language they produce. (We should) investigate the question of style in literary translation — not in the traditional sense of whether the style of a given author is adequately conveyed in the relevant translation but in terms of whether individual literary translators can be shown to use distinctive styles of their own.

Mona Baker, *Towards a methodology for investigating the style of a literary translator*, 2000
Stylometric authorship attribution

• in a set of texts, all you need know to order the texts by their authors are the frequencies of the most frequent words (sometimes as few as 30).
• stylometric authorship attribution only needs to compare the series of (relative) word frequencies for a collection of texts to correctly order the texts by their authors.
• this series for one text by one author will be most similar to this series for another text by the same author.
Burrows’s Delta Distance

“the mean of the absolute differences between the z-scores for a set of word-variables in a given text-group and the z-scores for the same set of word-variables in a target text”

J. Burrows, ‘Delta’ a measure of stylistic difference and a guide to likely authorship, LLC 2002
Burrows’s Delta Distance

For two texts $T$ and $T1$, and for a set of $n$ words,

$$
\Delta(T, T_1) = \frac{1}{n} \sum_{x=1}^{n} \left| z(f_i(T)) - z(f_i(T_1)) \right|
$$

Where 

$$
z(f_x(T)) = \frac{f_x(T) - \mu_x}{\sigma_x};
$$

$f_x(T) =$ raw frequency of word $x$ in text $T$;

$\mu_x =$ mean frequency of word $x$ in a collection of texts;

$\sigma_x =$ standard deviation of frequency of word $x$. 
It is a truth universally acknowledged, that a single man in possession of a good fortune, must be in want of a wife.

However...

I wish either my father or my mother, or indeed both of them, as they were in duty both equally bound to it, had minded what they were about when they begot me...

'NOW, what I want is, Facts. Teach these boys and girls nothing but Facts. Facts alone are wanted in life. Plant nothing else, and root out everything else...

I have just returned from a visit to my landlord - the solitary neighbour that I shall be troubled with. This is certainly a beautiful country!

...

3 Polish translations of Tolkien’s *Lord of the Rings*
Virginia Woolf, *Noc i dzień*

- Original, 1919
- Polish translation, 2010
- Translators:
  - Anna Kołyszko (d. 2009)
    - Rushdie, H. Miller, Roth, Nabokov, Kerouac, Lessing...
  - Magda Heydel
    - Woolf, Conrad, G. Swift, Heaney, Walcott...
- Collaboration:
  - Some two thirds translated by Anna Kołyszko
  - Magda Heydel translated the rest and edited the entire text
Heydel:

It is for the readers to see whether there is or there is not a rift in the middle of the book where one translator took over from another. I hope my editing made the narration coherent as far as the style was concerned. It was a truly unique experience to confront my own intuition of the authorial voice in the text with that of another translator.
Text divided into 37 equal sections (ca. 5000 word tokens)

Known:
• First section by Anna Kołyszko (kolyszko_night_01)
• Final section by Magda Heydel (kolyszko_night_37)

Other sections pretended unknown (woolf_night_02-36)

Classic Delta distance
Conclusions

• In a large collection of translations, it is easier to detect original authors than translators with multivariate analyses of word frequency...

• ...which might seem strange, since the former have little one-on-one counterparts in word frequency lists for original and translation.

• Translators can be sometimes detected when translations of texts by the same author are compared.
Conclusions

• The good news for the reading public is that, stylometrically speaking, translators usually remain more or less invisible.

• Some translators might be less enthusiastic.
Thank you!
